## PLANTS THAT EAT MEAT

There are more than 630 carnivorous plant species around the world, such a this pitcher plant. These plants get nutrients by digesting insects and small animals. While the primary food is insects, some plants have been known to eat frogs, birds and rats.

Nectar glands on the plant emit a sweet chemical that insects can't A slippery surface causes insects resist. But to loose footing while sticky these plants interior hairs that point downward, have to be trap an insect and prevent escape. careful with their lure ... They don't want to eat the insects that pollinate them! A Pitcher Plant takes about 2 days to completely consume a mosquito.
