

The Earth seems pretty big, especially if you're a puny, still-growing human. But compared to other planets, Earth is the puny one. The gas giant Jupiter is way bigger than the Earth is. Its mass is around 2 1/2 times that of all the other planets combined. With a diameter of 143,000 kilometers, Jupiter is so big that you could fit more than 1,300 Earths inside of it! Color this picture and draw yourself in a space suit or a spaceship in the area below.
